# Agenda

- The AWS ML Stack
- ML Services overview
- Labs
- What we'll cover today:
  - Loading data from Amazon Simple Storage Service (Amazon S3)
  - Training and deploying with built-in algorithms
  - Finding optimal hyperparameters with automatic model tuning
  - Deploying multiple models for A/B testing

# Our mission at AWS

---

Put machine learning in the  
hands of every developer

# MACHINE LEARNING IS HAPPENING IN COMPANIES OF EVERY SIZE AND INDUSTRY

Tens of thousands customers have chosen AWS for their ML workloads | More than twice as many customers using ML than any other cloud provider

# The AWS ML Stack

Broadest and most complete set of Machine Learning capabilities

xgboost\_customer\_churn.ipynr

- Have the predictor variable in the first column
- Not have a header row

But first, let's convert our categorical features into numeric features.

```
[ ]: model_data = pd.get_dummies(churn)
model_data = pd.concat([model_data['Churn?_True'], model_data.drop(['Churn?_True'], axis=1)], axis=1)
```

And now let's split the data into training, validation, and test sets. This will help prevent us from overfitting the model, and allow us to test the models accuracy on data it hasn't already seen.

```
[ ]: train_data, validation_data, test_data = np.split(model_data.sample(frac=1, random_state=123), [int(len(model_data)*0.7), int(len(model_data)*0.8)])
train_data.to_csv('train.csv', header=False, index=False)
validation_data.to_csv('validation.csv', header=False, index=False)
```

Now we'll upload these files to S3.

```
[ ]: boto3.Session().resource('s3').Bucket(bucket).Object(os.path.join(prefix, 'train.csv')).upload_file(train_data.to_csv(index=False).get_value())
boto3.Session().resource('s3').Bucket(bucket).Object(os.path.join(prefix, 'validation.csv')).upload_file(validation_data.to_csv(index=False).get_value())
```

Fully managed with auto-scaling for 75% less

Scale and manage the production environment

# Amazon SageMaker Ground Truth

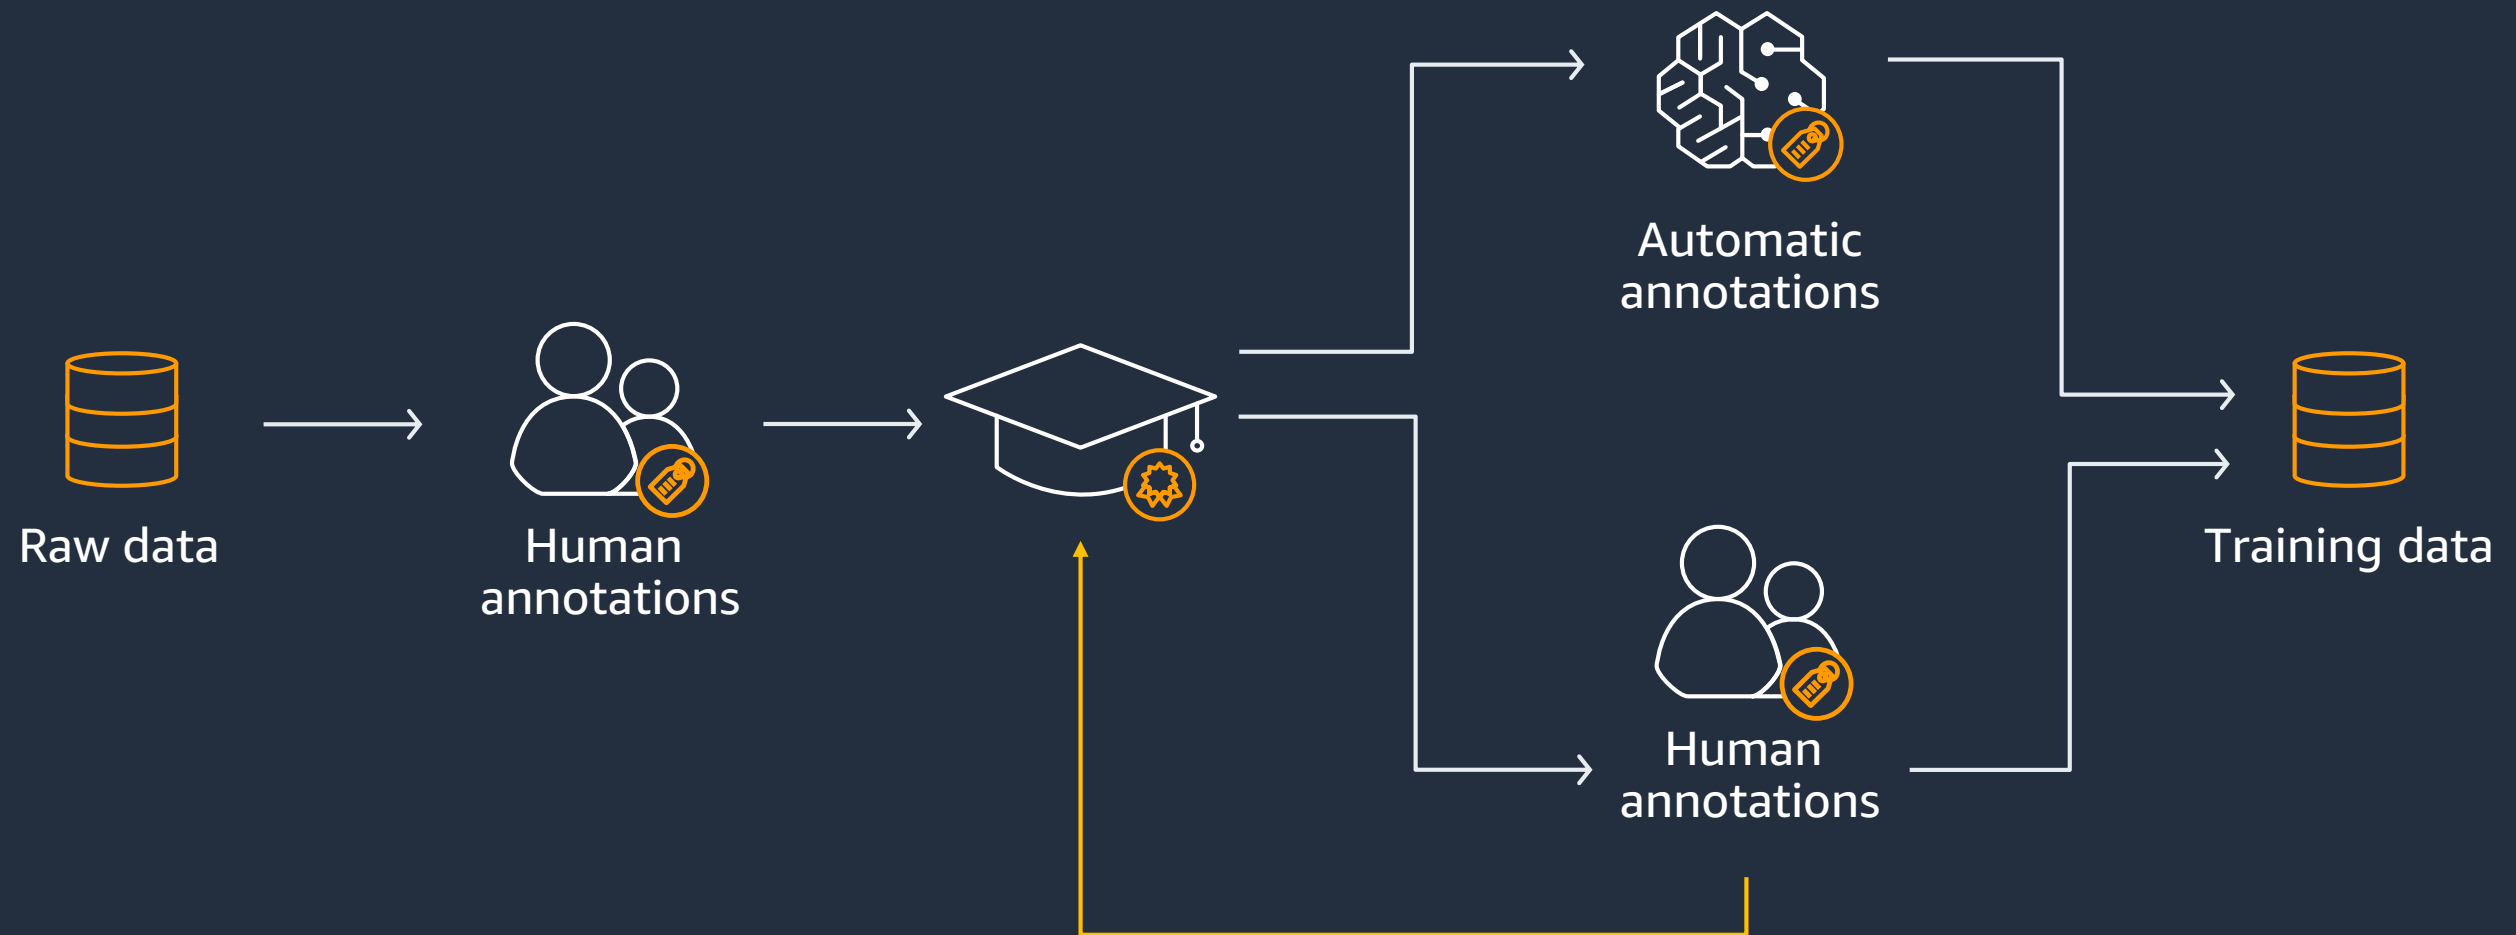

---

Build highly accurate training datasets using machine learning

- Reduce data labeling costs by up to 70%
- Access labelers through Amazon Mechanical Turk, Amazon approved vendors, or use private human labelers
- Achieve accurate results quickly

# How Amazon SageMaker Ground Truth Works

# Amazon SageMaker Processing

Analytics jobs for data processing and model evaluation

Fully managed

Achieve distributed processing for clusters

Custom processing

Bring your own script for feature engineering

Container support

Use SageMaker's built-in containers or bring your own

Security and compliance

Leverage SageMaker's security & compliance features

Automatic creation & termination

Your resources are created, configured, & terminated automatically

# Train your model with one click using Amazon SageMaker

Train with your  
own algorithms

Distributed  
by default

Train on a  
data stream

Single pass  
training

Not memory  
bound

Checkpoint  
for re-training

# Amazon SageMaker Automatic Model Tuning

Automatically tune hyperparameters across algorithms

Tuning at scale

Adjust thousands of different combinations of algorithm parameters

Automated

Uses ML to find the best parameters

Faster

Eliminate days or weeks of tedious manual work

## Examples

### Decision Trees

Tree depth  
Max leaf nodes  
Gamma  
Eta  
Lambda  
Alpha

### Neural Networks

Number of layers  
Hidden layer width  
Learning rate  
Embedding dimensions  
Dropout

# Amazon SageMaker Experiments

Organize, track, and compare training experiments

Tracking at scale

Track parameters & metrics across experiments & users

Custom organization

Organize experiments by teams, goals, & hypotheses

Visualization

Easily visualize experiments and compare

Metrics and logging

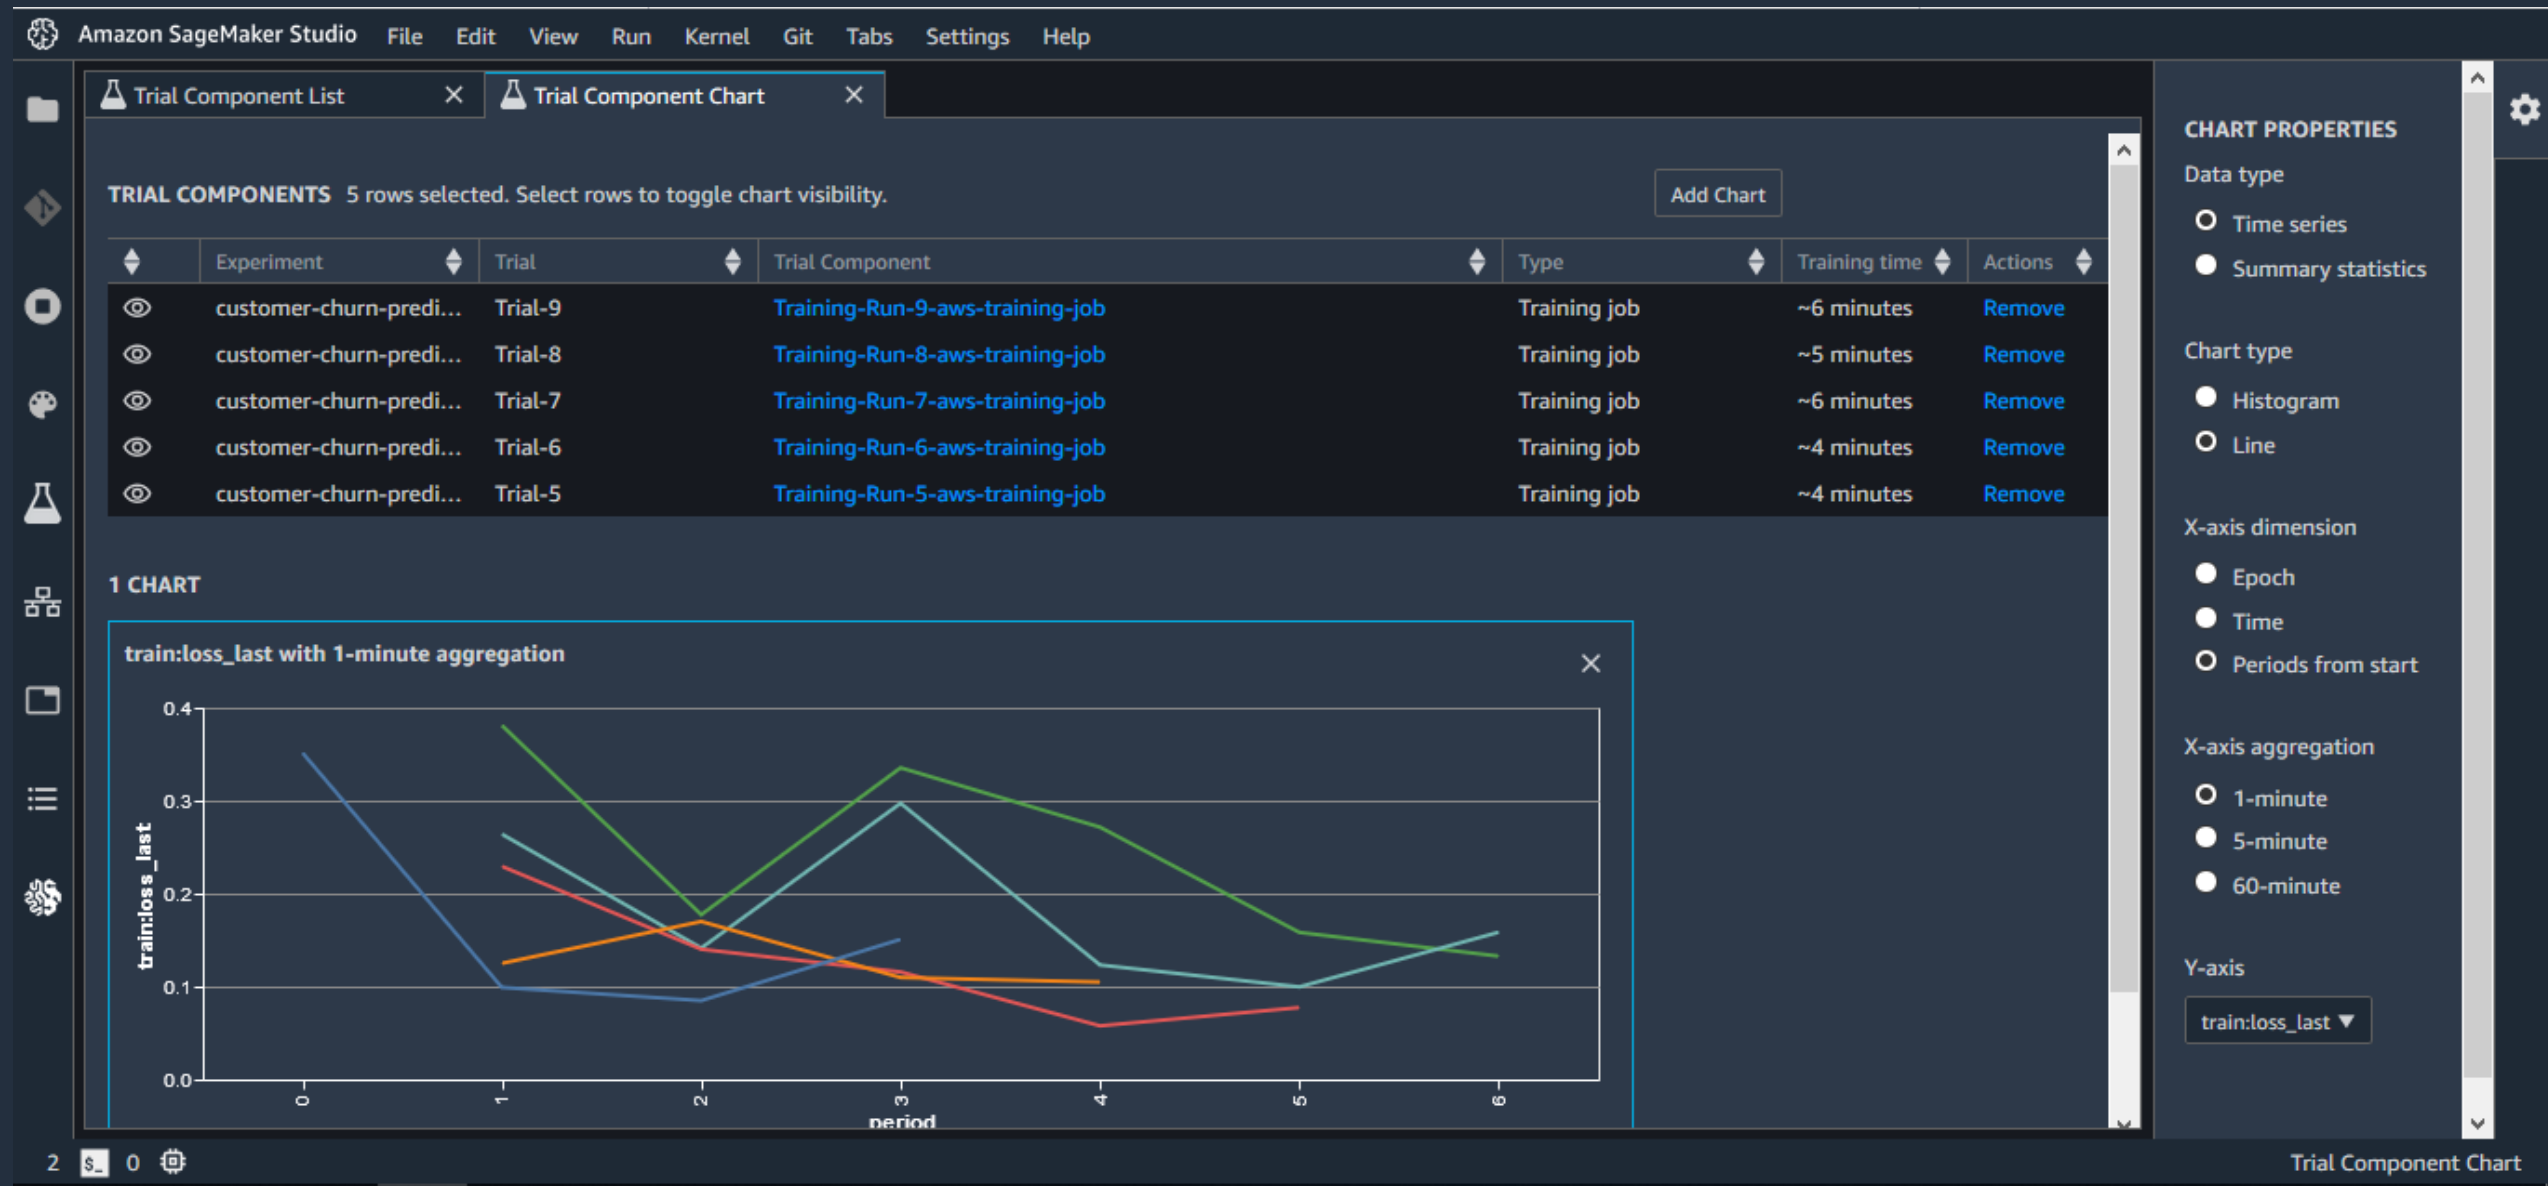

Log custom metrics using the Python SDK & APIs

Fast Iteration

Quickly go back & forth & maintain high-quality

# Use Amazon SageMaker Experiments to track and manage thousands of experiments

# Amazon SageMaker Debugger

Analysis and debugging, explainability, and alert generation

Relevant data  
capture

Data is automatically  
captured for analysis

Data analysis &  
debugging

Analyze & debug data with  
no code changes

Automatic error  
detection

Errors are automatically  
detected based on rules

Improved productivity  
with alerts

Take corrective action  
based on alerts

Visual analysis  
and debugging

Visually analyze & debug  
from SageMaker Studio

# Use Amazon SageMaker Debugger to identify issues such as vanishing gradients

Amazon SageMaker Studio

conda\_tensorflow\_p36

Using SageMaker Rules

In this example we'll demonstrate how to use SageMaker rules to be evaluated against your training. You can find the list of SageMaker rules and the configurations best suited for using them here.

We specify a few rules that check for overfitting, decrease in loss across epochs and for saturated activations.

```
[8]: estimator = TensorFlow(
    role=sagemaker.get_execution_role(),
    base_job_name='mnist-tensorflow-example',
    train_instance_count=1,
    train_instance_type='ml.p3.2xlarge',
    image_name=cpu_training_image,
    entry_point=entrypoint_script,
    framework_version='1.15',
    py_version='py3',
    train_max_run=3600,
    script_mode=True,
    sagemaker_session=sess,
    ## New parameter
    rules = [ Rule.sagemaker(rule_configs.vanishing_gradient()),
              Rule.custom(name='Overfitting', # used to identify the rule
                          image_uri='759209512951.dkr.ecr.us-west-2.amazonaws.com',
                          instance_type='ml.c4.xlarge', # instance type to run the rule
                          source='my_custom_rule.py', # path to the rule source file
                          rule_to_invoke='CustomGradientRule', # name of the class to invoke
                          volume_size_in_gb=400, # EBS volume size required to be attached to the instance
                          collections_to_save=[CollectionConfig(name='losses')], # collections to save
                          rule_parameters={
                              "threshold": "20.0" # this will be used to initialize the rule
                          },
                          hyperparameters = {'num_epochs': 100 }
                        ) ],
    hyperparameters = {'num_epochs': 100 }
)
```

Note that Sagemaker-Debugger is only supported for py\_version='py3' currently.

Let's start the training by calling `fit()` on the MXNet estimator

```
[9]: # After calling fit, SageMaker will spin off 1 training job and 1 rule job for you
# The rule evaluation status(es) will be visible in the training logs
# at regular intervals

estimator.fit(wait=False)
```

# Amazon SageMaker SDK

- AWS SDK for Python **orchestrating** all Amazon SageMaker activity
  - Algorithm selection, training, deploying, hyperparameter optimization, and so on
  - There's also a Spark SDK (Python and Scala), which we won't cover today
- **High-level objects** for:
  - Some built-in algos: K-means, PCA, and the like
  - Deep-learning libraries: TensorFlow, MXNet, PyTorch, Chainer
  - Sagemaker.estimator.estimator for everything else

<https://github.com/aws/sagemaker-python-sdk>

<https://sagemaker.readthedocs.io/en/latest/>

# Confusion matrix

		Predict	
		0	1
Actual	0	True negative	False positive
	1	False negative	True positive

		Predict	
		0	1
Actual	0	3567	71
	1	355	126

# Problem statement

Direct marketing is a common tactic to acquire customers. Because resources and a customer's attention are limited, the goal is to target only the subset of prospects who are likely to engage with a specific offer.

Predicting those potential customers based on readily available information like demographics, past interactions, and environmental factors is a common machine-learning problem.

We will train a model using XGBoost on a bank marketing dataset provided by UCI's ML Repository to predict if a customer will enroll for a term deposit at a bank after one or more phone calls.

# Walkthrough: Notebook instance setup

# Labs

1. Preparing the data
2. Training our first model with XGBoost
3. Deploying our model
4. Predicting with our model
5. Manually tuning our model
6. Finding optimal hyperparameters with automatic model tuning
7. Deploying our best 2 models
8. Predicting with our best 2 models
